

MoV Full Name	Discrimination and Stigma Scale
MoV Short Name	DISC
Relevant Goal Impact Indicator(s)	Subjective Well-being; Social Connectedness
Relevant for age ranges	18 years and older
Summary about MoV (including information about screening, monitoring, pre/post etc.)	The 32-item DISC is an interview-based scale which measures experiences of mental health-related discrimination within key areas of daily and social life, such as work, marriage, parenting, housing, leisure and religious activities. It was designed to be completed by people who have experienced challenges related to mental health. The scale has demonstrated to be a reliable and valid measure and has been utilized in over 60 countries.
Administration notes & Scoring Instructions (plus any links to scoring templates?; who best to administer)	This measure is administered as an interview. Link to administration manual and scoring: https://www.kcl.ac.uk/ioppn/depts/hspr/archive/cmh/CMH-Stigma-Measures/2DISC12manualversion3MAY2013.pdf
Summary scoring and interpretations (e.g., expected output from scores and what they will tell you)	A total score is calculated for each subscale by counting the number of items for which the participant scores 1 (a little), 2 (moderately) or 3 (a lot) in each subscale. Items which are scored as 0 (no difference), -8 (not applicable) or -9 (missing) are not included in this count. The possible range for each subscale is shown below: Subscale 1 - Unfair treatment (0-21), Subscale 2 - Stopping self (0-4), Subscale 3 - Overcoming stigma (0-2), Subscale 4 - Positive treatment (0-5)
Versions/ Related Measures	A shorter 11-item version of the DISC, called the DISCUS, was developed in 2019. Many translations have been completed. For more information: http://www.indigo-group.org/stigma-scales/
